Language: Russian

Pages: 159

A new, set-model of interpersonal perception is worked out. This mathematical model explains many well-known phenomena. The model is also used to predict conditions for the appearance of a number of new phenomena. Much attention is given to empirical verification of the suggested set-model and to creating research methods to study mechanisms of interpersonal perception. The potential use of the model in applied psychology is also discussed.

CONTENTS

Problems

History and Possible Solutions

The Key Facts

The Set-Model of the Interpersonal Perception

Psychological Presuppositions

Types of Interpersonal Evaluation

General Description of the Model

“Law of the Set” in Interpersonal Evaluation

Individual Differences in Interpersonal Evaluation

Interpersonal Perception of the Status:

The Explanation of Key Facts from the Set-Model’s Point of View

General Review of the Theoretical Predictions

Analysis and Discussion of the Accurate Predictions

Analysis and Discussion of the Inaccurate Predictions

Empirical Verification of the Set-Model

Types of Interpersonal Evaluation in Groups of Different Levels of Development

Groups Investigated and Methods Used

The Hypothesis and the Indicators of the Dominant Type of Interpersonal Evaluation

Results of Investigation

Individual Differences in the Interpersonal Perception

Extraversion and “Steepness” of the Evaluation Curve

Neuroticism and “Curvature” of the Evaluation Curve

Valency of an Attitude and Level of the Evaluation Curve
